Business Problem Statement: Optimizing Workforce Strategy and Attendance

Context As the organization transitions into a long-term operational model, there is a critical need to align workplace policies with employee behavior and health trends. Currently, the lack of centralized data on attendance patterns and leave usage hinders our ability to make data-driven decisions regarding real estate needs and employee wellness.

Problem Definition The leadership team lacks a comprehensive understanding of the following key metrics:

- **Workplace Preference:** We have not quantified the actual ratio of employees choosing **Work From Home (WFH)** versus **Work From Office (WFO)**, leading to potential inefficiencies in office space utilization and resource allocation.
- **Attendance Consistency:** There is no baseline for the **percentage of employees present** across various timeframes (weekly, monthly, and yearly), making it difficult to identify seasonal productivity dips or peak office capacity requirements.
- **Health & Absenteeism:** The current **sick leave percentage** has not been analyzed in correlation with working environments, preventing the HR team from identifying if specific work modes are contributing to higher burnout or illness rates.

Objective To analyze historical and current attendance data to identify trends in working preferences and absenteeism. This data will be used to optimize the hybrid work policy, right-size our physical office footprint, and implement targeted wellness initiatives to reduce sick leave.
